

# Case Study

### Sink Manufacturer's Dust Problems Down the Drain

Application: Sanding of Resin, Calcium and Stone

Product: Gold Series Modules Size: (1) GSB6 & (1) GSB8

Customer: Sink Factory Inc. (SFI) - Sparta, WI

Representative: Glacier Technology, Inc.

### Challenge

SFI is a manufacturer of cast polymer products. In 2004, they started their business in a facility that already had a baghouse dust collector in place. However, the volume of dust generated by the grinding and sanding of the cast sinks proved to be too great a challenge for the undersized collection system. Employees with protective masks worked in an environment of dust laden air and thick layers of settled particulate.

#### Solution

Farr sales rep Greg Schreier of Glacier Technology properly sized a six-cartridge Gold Series Module (GSB6) with horizontal inlets to accommo-

date the massive dust loading. The module was mounted outside and against one wall of the sanding/grinding room, drawing air through a large opening. SFI was quite pleased with the results.

When business and production increased for SFI, they decided to move to a larger facility in

well. Further, SFI had the idea to have the clean air from the Gold

over and behind the sanders to

Series units to be ducted back 75 feet

increase the air exchange rate. Their intent for the Gold Series units was two-fold: Collect the dust from the

## Farr APC Case Study (con't)

grinding operations immediately in front of the modules, and clear the air of nuisance dust through recirculation. They connected the sanding tools directly to a separate vacuum system.

The installation was a success and the Gold Series units are performing to high expectations, maintaining a clear environment for the 10 to 20 workers that are in the production area at any one time. SFI admitted consideration of competitive dust collection equipment, but was swayed to the Gold Series by the superior vertical cartridge design and by their success with their first Farr unit. In fact, neither unit has needed replace-

ment filters (over a year for the GSB8 and nearly two years for the GSB6), and the pressure drop has not yet exceeded 2" s.p. SFI continues to be pleased with the Gold Series' performance and they often receive compliments from visitors on how clean their operation is (see below!).
